Computer Architectures
2nd part labs – lab 2
Introducing gem5

1) Introducing gem5

gem5 is freely available at: <u>http://gem5.org/</u>

the laboratory version uses the ALPHA CPU model previously compiled and placed at:

```
/opt/gem5/
```

the ALPHA compilation chain is available at:

```
/opt/alphaev67-unknown-linux-gnu/bin/
```

    a. Write a hello world C program (`hello.c`). Then compile the program, using the ALPHA compiler, by running this command:

```
~/my_gem5Dir$ /opt/alphaev67-unknown-linux-gnu/bin/alphaev67-unknown-linux-
gnu-gcc -static -o hello hello.c
```

    b. Simulate the program

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -c hello
```

In this simulation, gem5 uses *AtomicSimpleCPU* by default.

    c. Check the results

your simulation output should be similar than the one provided in the following:

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -c
hello
gem5 Simulator System.  http://gem5.org
gem5 is copyrighted software; use the --copyright option for details.

gem5 compiled Sep 20 2017 12:34:54
gem5 started Jan 19 2018 10:57:58
gem5 executing on this_pc, pid 5477
command line: /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -c
hello

Global frequency set at 1000000000000 ticks per second
warn: DRAM device capacity (8192 Mbytes) does not match the address range assigned
(512 Mbytes)
0: system.remote_gdb.listener: listening for remote gdb #0 on port 7000
warn: ClockedObject: More than one power state change request encountered within the
same simulation tick
**** REAL SIMULATION ****
info: Entering event queue @ 0.  Starting simulation...
info: Increasing stack size by one page.
hola mundo!
Exiting @ tick 2623000 because target called exit()
```

    •   Check the output folder

in your working directory, gem5 creates an output folder (`m5out`), and saves there 3 files: `config.ini`, `config.json`, and `stats.txt`. In the following, some extracts of the produced files are reported.

    •   Statistics (`stats.txt`)

```
---------- Begin Simulation Statistics ----------
sim_seconds             0.000003      # Number of seconds simulated
sim_ticks               2623000       # Number of ticks simulated
final_tick              2623000       # Number of ticks from beginning of simulation
```

```
sim_freq           1000000000000    # Frequency of simulated ticks
host_inst_rate           1128003    # Simulator instruction rate (inst/s)
host_op_rate             1124782    # Simulator op (including micro ops) rate(op/s)
host_tick_rate         564081291    # Simulator tick rate (ticks/s)
host_mem_usage            640392    # Number of bytes of host memory used
host_seconds                0.00    # Real time elapsed on the host
sim_insts                   5217    # Number of instructions simulated
sim_ops                     5217    # Number of ops (including micro ops) simulated
... ... ...
system.cpu_clk_domain.clock 500     # Clock period in ticks
... ... ...
```

- Configuration file (`config.ini`)

```
... ... ...
[system.cpu]
type=AtomicSimpleCPU
children=dtb interrupts isa itb tracer workload
branchPred=Null
checker=Null
clk_domain=system.cpu_clk_domain
cpu_id=0
default_p_state=UNDEFINED
do_checkpoint_insts=true
do_quiesce=true
do_statistics_insts=true
dtb=system.cpu.dtb
eventq_index=0
fastmem=false
function_trace=false
```

2) Simulate the same program using different CPU models.

   Help command:

3)
```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -h
```

   List the CPU available models:
```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --list-
cpu-types
```

   a. *TimingSimpleCPU* simple CPU that includes an initial memory model interaction
```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --cpu-
type=timing -c hello
```

   b. *MinorCPU* the CPU is based on an in order pipeline
```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --cpu-
type=minor --caches -c hello
```

   c. *DerivO3CPU* is a superscalar processor
```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --cpu-
type=detailed --caches -c hello
```

Create a table gathering for every simulation the following information:
- Number of instructions simulated
- Number of instructions committed
- Number of CPU Clock Cycles
- CPI

3) Download the test programs related to the automotive sector available in MiBench: `basicmath`, `bitcount`, `qsort`, and `susan`. These programs are freely available at
http://vhosts.eecs.umich.edu/mibench/

   a) compile the programs using the provided *Makefile* using the ALPHA compiler
   hint:

   ---
   add a variable to the Makefile in order to use the ALPHA compiler:

   ```
   CROSS_COMPILE = /opt/alphaev67-unknown-linux-gnu/bin/alphaev67-unknown-linux-gnu
   CC=$(CROSS_COMPILE)-gcc
   ```

   and substitute all the `gcc` occurrences with the new variable as follows:

   gcc → $(CC)

   ---

   b) Simulate the programs using the *small* set of inputs and the default processor, saving the output results. In the case the simulation time is higher than a couple of minutes, modify the program in order to reduce the simulation time.
   c) Simulate the resulting programs using the gem5 out-of-order (*DerivO3CPU*) processor and collect the following information:
      a) Number of instructions simulated
      b) Number of instructions committed
      c) Number of CPU Clock Cycles
      d) CPI
      e) Prediction ratio for the available BPU
         a) Tournament predictor (it predicts conditional branches)
         b) BTB
         c) RAS (Return Address Stack for predicting return instructions)
         d) Indirect predictor (indirect jumps)
      f) Report the percentage of the different type of instructions that were executed in the simulation
      g) For any of the pipeline stages (fetch, decode, rename, issue, execute and commit) report a some of the available parameters that may indicate the stage activity during the simulation.
